Trans. of Masloboyno-Zhirovaye Promyshlennost'
(USSR) 1959, v. 25, no. 7, p. 36-39.

Typical soaps and synthetic detergents have the
ability to form micellar solutions at concentrations
within the limits 0.3 to 6 g/l and are capable of dis-
solving colloidally a considerable quantity of hydro-
carbons and polar substances. The efficiency of
soaps and detergents can be quantitatively character-
ised by an unbiased measurement of their colloidal
solubility and critical concentration of micelle-
formation (CCM). Optimum cleansing action is achieved
by aqueous solutions of detergents at concentrations
